

The Master Plan: A High-Performance WebAPP for Kiribati

I have fully analyzed your vision for the marketplace and the tourism platform. To make this "long-term vision" a reality, I will move away from WordPress and build a custom system using **Next.js and FastAPI with PostgreSQL database**.

This means your website will load **3 - 5 times faster** on mobile phones than the current version, and you will never have to pay for expensive "plugin fees" again. You will have a clean, professional, and private system that you own 100%.

1. The Development Phases (Average 12 Weeks)

To ensure quality, I will build the platform in four organized steps:

Phase 1: The Foundation (Weeks 1 - 2)

- Infrastructure: Setting up the FastAPI server and PostgreSQL database.
 - Deployment of the **FastAPI** server environment.
 - Configuration of the **PostgreSQL** database with 10 core tables.
 - Security hardening (SSL certificates and firewall setup) to protect your data.
- User System: Creating the core Authentication system (Sign up/Login) for three specific roles: Admin (The Client), Vendors (Artisans/Hotels), and Customers.
 - Custom login/signup flows for three distinct roles: Admin (You), Vendors (Sellers/Hotels), and Customers.
 - Password encryption and secure session management to prevent unauthorized access.
 - I will configure a secure subdomain development.XYZ.com as our private testing ground. I will set this subdomain to "No-Index" so that Google doesn't show your "work-in-progress" to the public, keeping the main domain clean and professional.
- The Brain: Developing the initial Admin Dashboard so the client can oversee from day one.
 - A central interface where you can view and manage users.
 - The setup of the "Moderation Queue" for reviewing pending content.
 - We will connect your purchased domain (XYZ.com) to a professional "Coming Soon" page featuring a live countdown timer.
 - The Benefit: I will submit your main domain to Google Search Console immediately. This signals to Google that a new, high-quality platform is coming, allowing the search engine to index your brand name and domain early.
 - By indexing the domain, we are warming up this app reputation with google. By the time we launch in Phase 4, this app will already be a trusted address in their system, which gives you a head start over competitors.
- What I will need from you in these two weeks:

- Your chosen domain name and logo (or brand colors if no logo yet)

Phase 1.1 - Payment:

- Payment 1 - \$300: Before work begins, initial design, and Coming Soon page.

Phase 2: Tourism & Culture (Weeks 3 - 6)

- Listing Engine: Building the logic for hotels and resorts (prices, amenities, and locations).
 - Custom forms for adding accommodations, including room types, amenities, and image galleries.
 - Dynamic pricing display for each stay.
- Content Pages: Developing the Next.js pages for Island Guides and Cultural Stories.
 - High-speed Next.js templates for travel guides and storytelling.
 - Optimized media handling to ensure beautiful photos load quickly on mobile devices.
- Booking Inquiries: Setting up the contact and inquiry system so international tourists can reach out to local hosts.
 - Contact forms that link tourists directly to specific listings.
- **What I will need from you in these 4 weeks:**
 - 20 sample photos of Kiribati (islands, culture, local products) for the design with detail.
 - A list of 2 to 3 real hotels or accommodations to use as the first test listings.
 - Your feedback within 24 hours when I send you a demo link for review and test.

Phase 2.1 - Payment:

- Payment 2 - \$300: After Phase 2 is complete (Tourism pages, hotel listings, island guides - fully working on the demo server for your review). You only pay when you are satisfied.

Phase 3: The Marketplace (Weeks 6 - 9)

- Vendor Portal: A private space where local artisans can upload photos of their handicrafts and set prices.
 - A simplified dashboard for local sellers to manage their own profiles.
 - Tools for vendors to upload products, set stock levels, and view their sales history.
- Product Catalog: Building the shopping grid with categories (Jewelry, Woven Mats, Household goods).
 - A searchable marketplace grid (e.g., Handicrafts, Clothing, Jewelry).
 - Shopping cart functionality designed to work smoothly on mobile browsers.
- The Approval Loop: Implementing the "Pending for Review" logic, ensuring no vendor product goes live without the client's confirmation.

- Implementation of the "Pending" status for all new vendor uploads.
- Approval/Rejection buttons in vendor and your Admin Dashboard to maintain brand quality.
- **What I will need from you in these 4 weeks:**
 - Names of 2 to 3 local artisans or vendors willing to be the first sellers

Phase 3.1 - Payment:

- Payment 3 - \$300: After Phase 3 is complete (Marketplace live, vendor portal working, product approval system done). You only pay when you are satisfied.

Phase 4: Final Polish & Launch (Weeks 9 - 12)

- Performance: Extreme optimization to ensure the site is mobile-first and lightning-fast on Pacific island internet.
 - Setup of the Manual Payment Flow (Telegraphic Transfer/Local Bank) where users upload receipts for your confirmation.
 - Integration of PayPal/Stripe for international customers.
- Testing: End-to-end testing of the checkout flow and inquiry forms.
 - Final code compression and caching to ensure the site is 3 - 5x faster than WordPress.
 - Rigorous testing on multiple mobile devices to ensure the inquiry forms and layout is perfect.
- Production: Moving the site from the demo server to the official launch and setting up the initial security firewall.
 - Execution of a comprehensive security sweep and delivery of the "Handover Document" (for Option 1), which includes all access keys, database backups, and technical ownership details.
- **Phase 4.1 - Final Payment Policy**
 - Payment 4 (\$300): This is due upon your final approval of the completed platform on the private development subdomain. Once this payment is received:
 - I will perform the final migration from the subdomain to your live domain (XYZ.com).
 - I will execute the final security sweep on the live production environment.
 - I will provide the full handover of all source code, database access, and documentation.

WHAT WILL BE FULLY WORKING AT LAUNCH (End of Week 12)

Fully working at launch:

- User accounts (Admin, Vendor, Customer roles).
- Hotel & accommodation listings with photos, prices, and amenities.
- Island guides and cultural story pages.

- Booking inquiry system (tourist contacts host directly).
- Marketplace with product catalog and shopping cart.
- Vendor portal (upload products, manage stock).
- Admin moderation dashboard (approve/reject listings).
- Manual payment flow (TT, local bank, receipt upload), or depend on the bank api options to automate payments.
- PayPal / Stripe for international customers “required some docs verification to access them or alternative options are available.
- Mobile-optimized, fast-loading on the Pacific internet.

Left for future upgrades (not in base price):

- AI chatbot for tourist inquiries
- Automated booking calendar with live availability
- Full online booking deposit system for hotel
- SEO/marketing campaigns

Technical Summary:

- Frontend: Next.js & Tailwind CSS (Responsive & Fast).
- Backend: FastAPI (Secure & High Performance).
- Data: 15 to 20 interconnected tables (Users, Hotels, Products, Orders, etc.).

2. How the System Works (Simple & Secure)

To ensure the platform is both robust and easy to manage, I am architecting a high-performance database using PostgreSQL. Unlike WordPress, which stores everything in a disorganized "general" table, this custom approach uses 10 specialized tables and 5 to 10 other tables, that act like a perfectly organized filing system. Each piece of information whether it is a hotel price, an artisan's bio, or a customer's payment has its own dedicated home. This prevents the website from slowing down as your business grows and keeps your data far more secure.

The Database Architecture

The system is built on a "Relational Model," meaning every piece of data is intelligently connected. Here is how the 10 tables manage your business:

1. Users: Stores secure, encrypted credentials for you, your vendors, and your customers.
2. Vendors/Artisans: Profiles for local businesses, including their stories and verification status.
3. Products: Detailed catalogs for handicrafts, jewelry, and local goods.
4. Hotels/Accommodations: Specific listings for resorts, rooms, and island stays.
5. Categories: Organizes the site (e.g., "Woven Mats" vs. "Beachfront Resorts") for easy browsing.
6. Island Guides: High-speed storage for the cultural stories and travel information.

7. Customer Inquiries: Tracks every message sent from a tourist to a host.
8. Orders: Manages the high-level details of every sale made on the platform.
9. Order Items: A granular breakdown of exactly what was purchased in each order.
10. Reviews & Ratings: Stores community feedback to build trust and authority for your brand.

In this custom system, I am implementing a Moderation Shield. When a local artisan or a hotel owner submits a new listing or updates a price, the system marks that entry as Status: Pending. It is invisible to the public. You will receive a notification in your Admin Dashboard where you can:

- Preview: See exactly how the listing looks on a mobile screen.
- Edit: Fix any spelling mistakes or adjust the photo.
- Approve/Reject: With one click, you decide if it meets your brand standards.
- If not see or approve so also the user approves themselves when he/she confirms.

3. Your Choice of Payment Plans

Please select the plan that works best for your current budget:

Option 1: Milestone-Based (Full Ownership)

I want to pay for the project in stages and own all technical assets entirely.

- Total Project Investment: \$1,200
- Initial Setup & Branding: \$300 (Includes securing your own custom domain, initial design, development server, and testing setup).
- Phase Payments: \$300 to be paid upon the successful completion of each major phase.
 - End of Phase 2 (Tourism): \$300.
 - End of Phase 3 (Marketplace): \$300.
 - End of Phase 4 (Final Polish & Launch): \$300.
- Ownership & Handover: Once the project is complete, all source code, files, hosting accounts, domain ownership, and security tools are handed over to you 100%.
- Future Updates: After the project is handed over, any new features or tools you wish to add will be charged a small, fair fee based on your specific requirements.

Option 1.1 - What Full Ownership Means

- 100% of the source code is yours.
- All hosting accounts are registered in your name.
- Full database backups and all access keys are handed to you.

- You own everything completely, forever

Option 2: Monthly Partnership (Ongoing Support)

A lower starting cost with a dedicated expert managing all technical aspects for you.

- Main Development Payment: \$500
- Initial Setup & Branding: \$150 (Includes securing your custom domain and initial testing setup).
 - End of Phase 2 (Tourism): \$150.
 - End of Phase 3 (Marketplace): \$100.
 - End of Phase 4 (Final Polish & Launch): \$100
- Post-Launch Service: After the project is complete, you pay a fixed \$50 USD per month. This covers professional hosting management, and site scalability.
- Technical Peace of Mind: In this option, the website runs under my managed hosting plans. I personally handle all technical issues, server maintenance, and updates so you can focus entirely on your business.
- Growth Scaling: As your platform grows and begins attracting heavy traffic, this monthly fee will increase to maintain the higher computing power and speed required.
- Future Updates: Similar to Option 1, any major new tools or features you wish to add later will be charged a small fee depending on the request.

Option 2.1 - What This Means for Your Code & Data

- The source code is still yours - I will provide it fully.
- Hosting runs under my managed plan for convenience, but the code itself belongs to you.
- You always have a copy of your own data and backups.

Can You Upgrade From Option 2 to Option 1 Later?

Yes, you can transition at any time. After 15 months, or whenever you're ready, simply pay the remaining balance to receive full ownership of all source code, database, hosting accounts, and access credentials, and complete data migration.

If you choose Option 1, I will send you the first invoice for \$300 and we begin Phase 1 immediately.

If you choose Option 2, the first invoice will be \$150.

4. How Payments Will Work in Practice

For Product Sales (Marketplace):

- All customer payments go to YOU first - not directly to vendors.

- You collect the payment, confirm it, then release the vendor's share.
- This gives you full control over every transaction and protects your brand.
- No automatic commission splitting in Version 1 - this keeps the system simple and secure at launch. A commission automation feature can be added later.

For Hotel / Accommodation Listings:

- A tourist sees the listing, fills a contact form, and the host responds directly to confirm and arrange payment.
- This is the safest and most practical approach for launch, as full online booking deposit systems require more complex legal and banking integrations.
- If you want to add direct booking payments later, I can build that as an upgrade.

Yes - the platform will support both local and international customers from day one.

Local customers (Kiribati & Pacific):

- Telegraphic Transfer (TT)
- Local bank transfer
- Manual proof of payment upload (customer uploads receipt, you confirm)

Local Kiribati: (these are optional first we have to confirm how I can use their API's in our system.)

- Cash (Australian Dollar — AUD)
- ANZ Bank Transfer
- Telegraphic Transfer (TT)
- Proof of Payment Upload (manual confirmation)

International customers will pay with:

- PayPal
- Stripe (credit/debit card)
- Wise
- Payoneer
- Remitly
- 5. Western Union

How it works:

- At checkout, the customer selects their payment method.
- If they choose TT or bank transfer, they see your bank details and upload their receipt.
- You review it in your Admin Dashboard and confirm the order manually.
- Simple and fully under your control.

5. Long-Term Maintenance & Success

Once your platform is live, it requires consistent care to remain fast, secure, and accessible to international tourists. I provide a managed service plan designed to scale alongside your success:

- **Performance & Security:** This plan ensures your site stays optimized and protected

against threats. The service fee starts at **\$50 per month** and can range up to **\$200 per month** as your platform grows.

- **Scaling with Traffic:** As your vision comes to life and more people visit the site to book hotels or buy local products, the system will require more "server power." When this happens, I will simply adjust your plan to provide the extra computing strength needed to handle thousands of visitors without slowing down.
- **Dedicated Support:** This isn't just for hosting; it means I am personally monitoring the "engine" of your website to ensure that every visitor from Kiribati or abroad has a smooth, professional experience.

This approach ensures that your platform stays reliable and high-performing from the first day of launch through your future growth across the Pacific.

MORE IMPORTANT

To ensure I have a clear path forward, it is important to distinguish between the initial build and the growth services I can provide once the platform is live. My primary focus now is the technical engineering of your custom system.

Here is a list of services that are not included in the initial development price, but are expert services I can provide to you after the project is complete to help you scale:

What is Not Included (Available as Future Services)

- **Advanced AI Integrations:** While the platform is built to be "AI-ready," specific features like AI Chatbots for tourist inquiries, automated AI content writing for your blog, or AI voice agents are separate specialized tasks. Once the site is live, I can integrate these to make your platform truly world-class.
- **Marketing & SEO Campaigns:** I build the site to be "SEO-friendly" (ready for Google), but the actual daily work of Digital Marketing, running social media ads, and managing keywords to rank #1 on Google is a separate service I can handle for you to drive traffic.
- **Professional Content Creation:** I provide the structure, but writing the high-quality articles, taking professional photography for hotels, or creating promotional videos can be managed as a separate creative project to ensure your brand looks top-tier.
- **Third-Party Transaction Management:** I will integrate the payment systems (like Stripe or PayPal), but managing the business side of these accounts and handling any fees they charge per sale (e.g., 2.9%) is the responsibility of the business owner.
- **Security Audits & Penetration Testing:** I build with high-level security standards, but a formal "Penetration Test" (hiring a firm to attempt to hack the site to find weaknesses) is a highly specialized service not included in the build.
- **Legal & Compliance:** Any legal documents for your region - such as Terms of Service, Privacy Policies, or marketplace registrations - must be provided by your legal advisor.
- **Data Entry:** I provide the system and dashboard, but the manual work of uploading hundreds of individual products or hotel descriptions is handled by you or your vendors.

The "Vision" Partnership

By keeping these items separate, I can focus 100% of my energy on building you the fastest and most secure custom platform. Once I launch, I am available to become your long-term partner for AI, Marketing, and Content Growth to ensure your platform becomes a massive success.

"We build the engine now; we supercharge it with AI and Marketing once we are on the road."
